Franciscan Health offers cardio-oncology services to care for cancer patients with a history of cardiovascular disease or those who may develop cardiac complications during or after treatment.

Our team of expert cardiologists collaborate with oncologists to provide comprehensive cardiovascular care to patients with cancer who have or are at risk for heart disease.

Patients with cancer may have a higher risk of developing cardiovascular disease, as cancer therapies may affect the heart and vascular systems. It is important to prevent, monitor, and treat cardiovascular disease in patients going through cancer treatment to ensure long-term health.

With new chemotherapeutic agents being developed, people are living much longer and having a healthy heart is crucial to being able to enjoy life.

CARDIOLOGY SERVICES WE OFFER:
• Heart risk assessment of patients prior to cancer treatment.
• Care for cancer patients with existing cardiovascular disease.
• Monitor and treat patients for heart complications during cancer treatment.
• Assessment of long-term cardiac risk in cancer survivors.
• Research on heart treatment and cancer patients.

If a patient is found to have cardio-toxicities (damage to heart muscle) during treatment with chemotherapy, the oncologist, the patient, and our cardio-oncology team will work together to decide the best course of action.

For more information on our services, call (317) 893-1900 or (800) 992-2081 or visit our website at FranciscanHealth.org/AdvancedCancerIndy.
