

OUR FACILITIES

INDIANA BLOOD & MARROW TRANSPLANTATION PROGRAM

The Franciscan Health Indiana Blood & Marrow Transplantation program provides patients with access to a full spectrum of hospital services and resources for any clinical situation and all levels of specialty care. In addition to the transplant nurses and physicians, patients have a transplant-dedicated, multidisciplinary support staff at their disposal, which include pharmacists, social workers, case managers, dietary experts, spiritual care consultants and patient advocates.

The stem cell transplant facilities are all conveniently located at Franciscan Health Indianapolis, just off I-65 South at County Line Road on the south-side of Indianapolis. A six-story inpatient bed tower was opened in March 2012, with 17 intensive-care-capable, HEPA-filtered transplant dedicated rooms designed to minimize the possibility of airborne infections. This unit also features a lounge for families, friends and recovering patients. It is complete with laundry facilities, internet services and food storage. The outpatient IBMT clinic is located on the first floor of Franciscan Health Cancer Center with committed parking facilities for easy access, as well as free valet parking. This clinic is staffed seven days a week with a support structure specifically designed to meet the needs of patients undergoing outpatient transplants, including stem cell collection.

The center has devoted on-site laboratory facilities for the collection and processing of all sources of donor stem cells. The stem cell laboratory routinely uses the most advanced techniques for processing bone marrow and peripheral blood stem cell products. The laboratory facility also serves as an outside reference laboratory for other stem cell programs. It processes both bone marrow and peripheral stem cell specimens for the National Marrow Donor Program, part of a worldwide network that locates and procures viable unrelated donor stem cell products for transplant. Some stem cell products are frozen and kept in the laboratory until needed.

The Radiation Therapy Department is also located in the Cancer Center and has extensive experience treating patients who require total body irradiation or other radiation treatments.

Our combination of devoted professional support staff and advanced facilities enable our transplant team to provide experienced and compassionate care in a modern patient and family-friendly environment.
